Change Record

Issue	Date	Page	Description of Change
0.9	09.08.2018}		completely new
1.0	\29th January 2019	Various	Editorial Changes (typos etc.)
		9	Added Section 3 to the document overview
		11	Added caption and table number to quick link table.
		13	Added caption and table number to value flag example table
		13	Added caption and table number to mask flag example table
		13	Clarified the explanation of flags with masks (endianness)
		13	Extended explanation of flag mask values
		14	Added remark that whole groups might be missing
		21	Clarified the explanation for slant column variable name
		22, 23	Corrected stratospheric column to tropospheric column
		25, 26	Clarified the meaning of proxy retrieval

1 Introduction

1.1 Purpose and Scope of the Document

SCIAMACHY (SCanning Imaging Absorption SpectroMeter for Atmospheric CHartographY) was one of the Earth observation research instruments which was part of the payload of the ENVISAT platform of ESA (European Space Agency) which had been launched on March 1st, 2002. The ENVISAT mission ended on April 8th 2012, following the unexpected loss of contact with the satellite.

The main scientific objective of SCIAMACHY was to measure distributions of a number of chemically important atmospheric trace gas species on a global basis. SCIAMACHY had a spectrometer and telescope system designed to observe light transmitted through, reflected by and scattered from the Earth's atmosphere over a spectral range from 240 to 2400 nm. It had an alternating limb and nadir viewing capability, and was able to perform solar and lunar occultation measurements.

Nadir UV/visible measurements provide global column distributions of O₃, NO₂, BrO, SO₂, OCIO, HCHO, CHO-CHO and H₂O, as well as cloud and aerosol parameters. Nadir infrared measurements are used to generate column distributions of CO and CH₄. Limb observations provide vertical stratospheric profiles of O₃, NO₂ and BrO for UV/visible wavelength range. By combining limb and nadir measurements tropospheric NO₂ columns are retrieved. Tropospheric columns are also available for BrO.

This document provides the specification of the level 2 off-line product as generated by version 7.00 of the level 1b to 2 off-line processor. For this version the product format was changed from the ENVISAT binary format to netCDF V4.

The document is not intended to give background on the retrieval algorithms, for this the user should consult the ATBD [5].

The main advantages of the new format are:

- NetCDF is a standard, widely used, self-describing format that ensures that the data can be read in the future.
- All results are easily accessible via a dedicated variable. Inconveniences of the old format, such as appending results to additional diagnostics that required complicated index operations for read access, are now fixed.
- Geolocation is now available per species (taken from level 1b product). Previously only geolocations for the shortest integration time were contained in the level 2 product and the user was responsible for calculating the coordinates for a given species on his own.
- Obsolete parameters were removed from the product.

SACURA	Semi-Analytical CloUd Retrieval Algorithm
SZA	Solar Zenith Angle
TOA	Top of Atmosphere
VCD	Vertical Column Density

1.4 Document Overview

Section 2 explains the overall structure of the format and gives additional explanations for specific entries. In order to make the migration from the ENIVSAT format to the netCDF format easier, in Section 3 we give tables that show the correspondence between the old product variable names and the netCDF names. Sections 4 to 9 contain information for all netCDF entries in tabular form. The tables are directly extracted from a Level 2 netCDF file generated by the operational processor. This ensures that the variable names and attributes in this document exactly match those in the operational products. Thus, in cases where we show values for attributes or variables, these are those from the file chosen for the generation of the tables. They are only shown for illustration purposes and can be different for other products.

The global file attributes are listed in section 4. The following sections contain the data entries for the product. In section 10 we have one table for each group of metadata (EOP, ESA and ISO). The metadata are separated into many sublevels. For each sublevel we add a "/" to the name of the group in the first column of the table. Rows where a new group starts are coloured in light cyan. For example "./gmd:contact" is a subgroup of the ISO metadata group. Below that another subgroup "./gmd:contactInfo" exists and so on.

For the other data a less compact (and easier to navigate) document structure was chosen, since here we do not have as many levels as for the metadata. The description of the variables and the group attributes are structured along the groups in the netCDF file like this:

- *Top Group*: Section
 - *Subgroup*: Subsection
 - *Subgroup of Subgroup*: Subsubsection

and so on. The section names are simply the group names. Every group has one table for the group attributes (if any) and one table for the variables (if any). The tables for the group attributes contain the attribute's name and the value. We give no description because the names are self-explanatory and the value (like "used wavelength range") are more useful for the reader. The tables for the variables contain

1. Name of the variable
2. The description
3. The unit
4. The data type
5. The number of dimensions, if the data are organised in arrays

and are all taken directly from an operational product.

With this information the user can quickly extract data of interest by using standard S/W and the names of the variables.

Since the geographical data are the same for all Nadir and all Limb data, we do not repeat their description for each measurement data set but we describe them one time in Section 5 (Nadir) and 6 (Limb).

In this document we use the following convention: Internal document links are marked in dark green and can be clicked to navigate through the document. External links are marked in red and can be clicked to access the corresponding URL with your standard internet browser.

1.5 Quick Look-Up

The table below gives quick links per product to find the following information quickly:

Flag description Flags used in the MDS for the product are described in these sections

Correspondence to old product names (old/new)

If you migrate from the old ENVISAT format, look up the indicated sections

Geolocation description (Geo)

Geolocation is described in these sections

MDS description (MDS)

The measurement data variables are described in these sections.

In the electronic version of the document you can click on the links in the table to jump to the correct location

Table 1: Quick links to important information per product.

Product	Flags	old/new	Geo	MDS
Limb Cloud	2.8.1.2	3.9	6	9.1
Limb BrO	-	3.8	6	9.2
Limb NO ₂	-	3.8	6	9.3
Limb O ₃	-	3.8	6	9.4
Nadir AAI	2.8.1.1	3.6	5	9.5
Nadir Clouds	2.8.1.1	3.6	5	9.5
Nadir CH ₄	2.8.3.2	3.7.5	5	9.6
Nadir CO	2.8.3.2	3.7.6	5	9.7
Nadir BrO (total & tropospheric)	2.8.4.1	3.7.2	5	9.8
Nadir CHOCHO	2.8.2.1	3.7	5	9.9
Nadir HCHO	2.8.2.1	3.7	5	9.10
Nadir H ₂ O	2.8.2.1	3.7.4	5	9.11
Nadir NO ₂ (total & tropospheric)	2.8.2.1	3.7.1	5	9.12
Nadir O ₃	2.8.2.1	3.7	5	9.13
Nadir OCIO	2.8.2.1	3.7	5	9.14
Nadir SO ₂ (anthropogenic & volcanic)	2.8.2.1	3.7, 3.7.3	5	9.15

Information about the not MDS linked entries can be found in the first subsections of Sections 2, 3. Global attributes (e.g. reference time) are found in Section 4. Annotation data can be found in sections 7 and 8. Metadata tables are in section 10.

2 File Structure and Additional Information

2.1 Measurement Times

Measurement times are expressed as difference in seconds to the reference time of midnight of the day of measurements. The reference time can be found in the global attribute `time_reference`, see Section 4.

2.2 Units

Wherever reasonable, SI units are used for the file variables. Group attributes are strings. Latitudes and longitudes are expressed in degrees:

- Latitude -90° ... 90°
- Longitude -180° ... 180°

2.3 Fill Values

In cases where the retrieval did not converge or came to an unphysical solution or data are missing for some other reason, *fill values* are used. The definition of the fill values is part of the netCDF group and will be recognised by various netCDF readers (e.g. in python one will obtain a masked array where the entries containing a fill value are masked).

2.4 Metadata

The following metadata were added to the netCDF file for cataloguing, discoverability and compatibility with Sentinel data:

1. EOP metadata: INSPIRE Metadata Implementing Rules, Technical Guidelines [1]
2. ESA metadata: Earth Observation Ground Segment File Format Standard [2]
3. ISO metadata: Geographic Information – Observations and measurements [4]

Note that some information is repeated in the different metadata groups, since the definitions partially overlap.

2.5 Global File Attributes

The global attributes (tables in Section 4) contain information about the format of the file, the used conventions, and the source of the data. The coverage in time and the processor version are also listed.

2.6 Annotation Data

The Annotation Data contain the geolocations for all nadir and limb observations (Sections 7.2 and 7.1) for the shortest integration time of the orbit. Note that the geolocations for specific atmospheric products are contained in the measurement data set groups themselves.

The States geolocation group (Section 7.3) contains the state IDs, integration time and corner coordinates of the area covered by the state.

The Global Annotation Data (Section 8.1) contains only one string parameter, *xml_text_initialisation_file*. The string contains the processor configuration file used for processing. It is intended for tracing the configuration and is of possible use of expert users.

2.7 Flagging

In the CF standard [3] all flags have the attribute *flag_meanings* and then one or both of the attributes *flag_values* and *flag_masks*. We follow this standard. *flag_meanings* are implemented as comma separated string. *flag_values* can be anything (number, string). *flag_masks* typically are numbers. Each element of the flag meanings has an associated *flag_values* or *flag_masks* element.

Example:

```
flag_meanings      "laser gun, sword"  
flag_values        ["Han", "Luke"]
```

means that if you encounter "Han" as flag value, the corresponding flag meaning is "laser gun". The same association can be made with flag mask values (then usually with bit values).

In the Level 2 product we use flags that have either flag values or flag masks. The variable names of flags usually end with "_flag", so they can be easily identified. Exception to these rules:

cloud_diagnostics The diagnostics of the Limb Cloud MDS are implemented as a flag

Flags for the individual measurements will be explained in section 2.8.

2.7.1 Flags with values

Flags with values can be evaluated by direct comparison. The value of the variable can only be one of the values in the attribute *flag_values* (or the fill value). One example is the backscan flag:

Table 2: Example for value flags.

Flag Meaning	Flag Value
forward_scan	0
backward_scan	1

Thus if you want to exclude backscans from your analysis, you can use a construct like

```
Loop over scans:
  if (backscan_flag == 1) then continue
  else
    do something
end loop
```

2.7.2 Flags with mask values

The definition of flag mask values follows the CF standard V1.6 ([3], see section 3.5 therein), Flags that have masks associated indicate which of a number of conditions are fulfilled. They are used when more than one state is possible at the same time. They have to be evaluated bit-wise.

The number of bytes for a flag varies according to the number of conditions they are representing.

The most significant bit is always associated with the *first* statement in flag meanings. Note that not always all bits carry meaning. The lowest number of the flag_mask stands for the last bit that carries a meaning. All bits lower are irrelevant.¹

Example for a 16bit variable:

Table 3: Example for mask flags.

Flag Meaning	Flag mask
convergence reached	32768
sza lower than limit	16384
residual norm lower than limit	8192

We see the following:

1. Only the first 3 bits carry meanings, all other bits are irrelevant
2. If the most significant bit of the variable value is set the condition in the flag meaning is true, i.e. convergence was reached. If the bit is not set, convergence was not reached...
3. ... and the same for the other flag meanings

The value of the variable in the netCDF is the *sum* of those flag mask values where the condition is true. For the above example:

Table 4: Possible flag values.

Convergence	sza lower	residual lower	Value
Y	N	N	32768
N	Y	N	16384
N	N	Y	8192
Y	Y	N	49152
N	Y	Y	24576

Continued on next page

¹Contrary to the old ENVISAT format, which was a byte stream, the endianess of the platform is not important: The attributes of the flags contain all information one needs to determine if a certain condition is fulfilled or if it isn't.

Continued from previous page

Convergence	sza lower	residual lower	Value
Y	N	Y	40960
Y	Y	Y	57344
N	N	N	0

The values are read as an integer value which then can be used to evaluate the flags with a bit-wise AND operation, e.g.

```
# Check SZA:  
sza_is_lower = flag (bit-wise AND) 16384
```

Combinations of flags set can be checked in a similar way by constructing a mask to be matched from the flag mask values (by using the sums) or by iterating through all possible conditions:

```
# Check SZA & Residual Norm  
sza_is_lower = flag (bit-wise AND) 16384  
res_norm = flag (bit-wise AND) 8192  
#  
both_set = (sza_is_lower > 0 and res_norm > 0)
```

2.8 Measurement Data

The measurement data (Section 9) are arranged along observation modes (limb or nadir) and species. The naming scheme of the groups follows the convention of the previous ENVISAT format:

(observation mode)_(_wavelength region)_(_species)

For cloud products the wavelength range is omitted, since the retrievals use multiple wavelength regions.

All groups that contain results of trace gas retrievals have attributes that describe the wavelengths range of the retrieval window, the observation geometry, the main species fitted as well as additional info were deemed necessary.

Note that not all MDS contain all types of entries. If a value is not calculated for a given trace gas, it is omitted from the netCDF group. This happens, e.g. for some error types which are not calculated in all algorithms.

Also, if a certain product for a species cannot be retrieved for a given orbit, the whole measurement data group for this product is omitted from the product. Therefore, before reading data, one should check if the group exists in the data file to avoid program crashes.

Recommended settings for flags will be published in a README document that accompanies each product release. Since the settings may change after product evaluation they are not stated here. The README file will always be updated to reflect the latest status and current product knowledge.

2.8.1 Cloud Data

Cloud data for nadir and limb can be found in Sections 9.5 and 9.1. Nadir cloud parameters are cloud top height, cloud optical depth and cloud fraction. In addition the nadir cloud data set also contains the AAI.

The limb cloud group contains types of clouds (PSC, water cloud, ice cloud, NLC) and their heights and auxiliary information such as the color index ratio (CIR) used to identify clouds and the maximum altitude of the cloud.

2.8.1.1 Nadir Cloud & AAI Flags

The nadir cloud & AAI MDS has the following flags

Table 5: Flag meanings for *cloud_flag* for the cloud calculations. When the bit is set the italic condition is true.

Flag Meaning	Flag Mask
source of cloud fraction PMD or fitting	128
source of cloud-top pressure in <i>VCD algorithm</i> or ISCCP	64
source of cloud-top height fitting - SACURA: <i>no convergence</i>	32
source of cloud-top height fitting - SACURA: <i>number of iterations exceeded</i>	16
source of cloud-top height fitting - SACURA: <i>average of neighboured values taken</i>	8
source of cloud-top height fitting - SACURA: <i>cloud layer size set to constraint</i>	4
source of cloud-top height fitting - SACURA: <i>cloud-bottom height set to constraint</i>	2

Note that SACURA provides a sophisticated flagging at output which mirrors if a constraint is set for a quantity during the fitting. This may happen if cloud-bottom height, cloud-top height, or cloud layer size exceed pre-defined constraints. In that case, each quantity can be individually set to the constraint value. In case SACURA exceeds the number of iterations, the arithmetic average of the neighbour values is taken. If cloud-clear condition is reflected from the PMD algorithm, cloud-top height and cloud optical thickness are set to 0. In case of SACURA, an error of 0.25 km can be expected for full convergence; otherwise 0.5 km.

Table 6: Flag meanings for *absorbing_aerosol_indicator_flag*. If the bit is set, the condition is true.

Flag Meaning	Flag Mask
Rayleigh scattering correction successful	128
AAIA computation successfully ended	64

In case AAI values are not computed, but just copied from observations with longer integration times, AAI flags remain unset.

Table 7: Flag meanings for *backscan_flag*.

Flag Meaning	Flag Value
forward scan	0
backward scan	1

2.8.1.2 Limb Cloud Flags

The Limb cloud MDS has the following flags

Table 8: Flag meanings for *water_cloud_flag*

Flag Meaning	Flag Value
no clouds	0
partially cloudy	1
fully cloudy	2
bad data or cloud top height too high	3
threshold exceeded two times	4
threshold exceeded multiple times	5

Table 9: Flag meanings for *ice_cloud_flag*

Flag Meaning	Flag Value
water cloud	0
ice cloud	1
bad data (MAXHEIGHT_ICL is greater than the warning tangent height , warn_th)	2
strange case (MAXVAL_ICL is greater than the upper bound for the CIR, upper_bound_cir)	9

Table 10: Flag meanings for polar_stratospheric_cloud_flag

Flag Meaning	Flag Value
no PSC	0
PSC	1

Table 11: Flag meanings for noctilucent_cloud_flag

Flag Meaning	Flag Value
no NLC	0
NLC criterion 1 fulfilled (radiance increase with height)	1
NLC criterion 2 fulfilled (radiance ratios above threshold)	2
both NLC criteria fulfilled	3

Table 12: Flag meanings for cloud_diagnostics describing the status of the cloud algorithm.

Flag Meaning	Mask Value
water/ice/aerosol cloud retrieval succeeded	128
ice/water cloud retrieval succeeded	64
polar stratospheric cloud retrieval succeeded	32
noctilucent cloud retrieval succeeded	16

2.8.2 Nadir DOAS Retrievals

The DOAS retrievals contain slant and vertical column density (SCD, VCD), air mass factors, errors and other fit parameters and the geolocation of the measurements. For SO₂ there are anthropogenic and volcanic VCDs available.

2.8.2.1 Flags

The Nadir MDS for the DOAS retrievals has the following flags

Table 13: Flag meanings for vertical_column_density_flag describing the VCD calculation.

Flag Meaning	Flag Mask
extended field-of-view calculation	32768
maximum SZA reached	16384
no weighting of AMFs over footprint	8192
linear weighting of AMFs over footprint	4096
parabolic weighting of AMFs over footprint	2048

Table 14: Flag meanings for fitting_flag used for SCD fitting.

Flag Meaning	Flag Mask
smoothing of measurements	32768
error weighting of fitting	16384
use of ratioed measurements	8192
use of pre-convoluted cross-sections	4096
convolution of cross-sections	2048
convolution on measurement grid	1024
SCIAMACHY cross-sections used	512
non-linear fitting (if not set linear fitting is used)	256
use of background correction	128
bit 6-4: quality, to be interpreted as 3 bit integer, 0 lowest quality, 7 highest quality	112

Table 15: Flag meanings for *air_mass_factor_flag* used in the AMF look-up scheme. *Italic* values are true, if the bit is set.

Flag Meaning	Flag Mask
clear or <i>clear & cloud</i> look-up	128
one AMF value or <i>extended field-of-view</i>	64
continental or <i>maritime</i> aerosol present	32
<i>maximum SZA exceeded</i>	16

Table 16: Flag meanings for *backscan_flag*

Flag Meaning	Flag Value
forward scan	0
backward scan	1

2.8.3 Nadir Direct Retrievals

Water vapour (AMC DOAS algorithm, see Section 2.8.3.1), CO and CH₄ (both BIRRA algorithm, see Section 2.8.3.2) use direct retrieval schemes. They do not have slant columns but only vertical columns. The errors and fit parameters also differ partially from DOAS retrievals.

2.8.3.1 AMC DOAS Flags

The AMC DOAS MDS for water vapour has the following flags

Table 17: Flag meanings for *backscan_flag*

Flag Meaning	Flag Value
forward scan	0
backward scan	1

2.8.3.2 BIRRA Flags

The MDS for CO and CH₄ have the following flags

Table 18: Flag meanings for *vertical_column_density_flag* for the calculation of the VCD.

Flag Meaning	Flag Mask
convergence reached	32768
sza lower than limit	16384
residual norm lower than limit	8192
maximum absolute value of residual lower than limit	4096
α between bounds for first gas	2048
absolute α error less than limit for first gas	1024
α between bounds for second gas	512
absolute α error less than limit for second gas	256
α between bounds for third gas	128
absolute α error less than limit for third gas	64
α between bounds for fourth gas	32
absolute α error less than limit for fourth gas	16

α is the fitted scaling factor used in the retrieval.

Table 19: Flag meanings for backscan_flag

Flag Meaning	Flag Value
forward scan	0
backward scan	1

2.8.4 Tropospheric Columns

For BrO and NO₂ we also calculate a tropospheric column. The results of these retrievals can be found in the nadir retrieval groups of the species (Sections 9.8 and 9.12).

2.8.4.1 Flags

The NO₂ MDS has the same flags and flag meanings as the Nadir DOAS flags (see Sect. 2.8.2.1)

The BrO product has only a subset of flags of the DOAS retrievals defined, since the VCD calculation is not done with the standard DOAS scheme.

Table 20: Flag meanings for fitting_flag used for the BrO SCD fitting.

Flag Meaning	Flag Mask
smoothing of measurements	32768
error weighting of fitting	16384
use of ratioed measurements	8192
use of pre-convoluted cross-sections	4096
convolution of cross-sections	2048
convolution on measurement grid	1024
SCIAMACHY cross-sections used	512
non-linear fitting	256
use of background correction	128
bit 6-4: quality, to be interpreted as 3 bit integer, 0 lowest quality, 7 highest quality	112

Table 21: Flag meanings for backscan_flag

Flag Meaning	Flag Value
forward scan	0
backward scan	1

2.8.5 Limb Retrievals

The limb retrieval groups contain profiles in number density as well as volume mixing ratios (the latter being calculated from the number densities). Temperature and pressure grids used for the retrieval, error and the averaging kernels are also part of the data. The new format has the advantage that all parameters now have their own variable and are easier accessible than in the previous format (where some of the data were just stored in a large array and had to be accessed via complicated index operations).

Note that the number of values for a profile can vary with time for a given trace gas. The reason is that the retrieval always starts at the lowest cloud free altitude. This altitude is determined by the Limb Cloud algorithm. In the presence of cloud above the minimum altitude for the retrieval, the altitude step is skipped and the concerned profile has less values than in the cloud free case.

3 Correspondence between Variables in ENVISAT Format and netCDF

This section contains tables that show the change of the variables in the new format from the names in the ENVISAT format. We also indicate which variables were deleted. Reasons for deletion of a variable were that

they are no longer needed in the new format (e.g. entry length in bytes) or that they were placeholders and never calculated. For each ENVISAT element we list the name of the ENVISAT field and the corresponding netCDF variable.

The following cases are highlighted in the tables:

not needed	Entry is no longer needed in the netCDF, this marked in light gray
not calculated	Entry was never calculated in the processor and was thus removed from the new format, this is marked in very light gray
Split of variables	In some cases parameters were "hidden" in one variable in the old format. In the netCDF this is never the case. This is marked in light cyan .

The sections below are structured according to the ENVISAT file structure, i.e. for each ADS or MDS type there is a subsection. Since the nadir MDS contains several subtypes, this subsection has subsections on its own.

3.1 Geolocation of the state ADS

Description	ENVISAT Entry	netCDF Entry
time offset in seconds from midnight	STARTTIME	delta_time
attach flag	ATTACHED	not needed
corner latitudes of the ground scene which is covered by the state	CORNERS	corner_latitudes
corner longitudes of the ground scene which is covered by the state	CORNERS	corner_longitudes

3.2 Static Parameter GADS

Description	ENVISAT Entry	netCDF Entry
XML text of the initialization file which covers the complete range of static parameters	XMLPARAMS	xml_text_initialization_file

3.3 States of the Product ADS

Description	ENVISAT Entry	netCDF Entry
time offset in seconds from midnight	STARTTIME	delta_time
attach flag	ATTACHED	not needed
state ID	STATEID	state_id
longest integration time	LONGEST	longest_integration_time
shortest integration time	SHORTEST	shortest_integration_time
duration of scan phase of the state	DURATION	duration
number of geolocation records for this state	NOOFOBS	number_observations

3.4 Nadir Geolocation ADS

Description	ENVISAT Entry	netCDF Entry
time offset in seconds from midnight	STARTTIME	delta_time
attach flag	ATTACHED	not needed
integration time of measurement	INTTIME	integration_time
solar zenith angles of the start, middle and end of the integration time at TOA	SOLARZEN	solar Zenith_angles

Error on the AMF to cloud-top	ERRAMFCLD	air_mass_factor_cloud_error
AMF output flag	AMFFLAG	air_mass_factor_flag
Temperature of reference spectrum	TEMPERATURE	temperature_of_reference_spectrum (group attribute)

For Ozone an *effective* slant column is retrieved, therefore the variable for the slant column is named *effective_slant_column*. For other trace gases the name of the netCDF entry is *slant_column_density*.

3.7.1 Nadir NO2

Two NO_2 retrievals are combined in the netCDF group /MEASUREMENT_DATA/NADIR_UV_NO2: The retrieval of the total column and the retrieval of the tropospheric column. In the ENVISAT format the retrievals are in separate MDS's. The relation for the total column is

Description	ENVISAT Entry	Name

tropospheric AMF	F	AMFGRD	tropospheric_air_mass_factor
stratospheric AMF	F	AMFCLD	stratospheric_air_mass_factor

3.7.3 Nadir SO2

For this product again two ENVISAT format MDS were merged: the one for the anthropogenic column and the one for the volcanic column. The difference for the two calculations is the SO_2 profile peak position. The netCDF file thus contains the following entries

Description	ENVISAT Entry	Name
vertical column density for anthropogenic SO_2	VCD	vertical_column_density_anthropogenic
vertical column density for volcanic SO_2	VCD	vertical_column_density_volcanic
error on the vertical column density for anthropogenic SO_2	VCD	vertical_column_density_error_anthropogenic

3.7.5 Nadir CH4

In the methane retrieval no slant column and no AMF is needed. Two vertical column densities are calculated: xCH₄ (proxy) and CH₄ (no proxy). The proxy retrieval uses the CO₂ parameter that is retrieved together with the methane column to correct for light path effects (see also [5])

Description	ENVISAT Entry	Name

5 Geolocation Group for Nadir Measurements

All Nadir measurements have the following subgroup containing the coordinates for the measurements.

Table 39: *Attributes for group GEODATA*

Name	Value
top_of_atmosphere	100000m

Table 40: *Variables of group GEODATA*

Name	Description	Unit	Type	Dimensions
earth_radius	earth radius	m	float32	1
esm_position	elevation scan mirror position	degree	float32	1

Continued on next page

Continued from previous page

Name	Description	Unit	Type	Dimensions
latitude	center latitude of each observation	degrees north	float32	1
latitude_bounds	corner coordinate latitudes of each observation	degrees north	float32	2
latitude_subsatellite	sub-satellite latitude of each observation	degrees north	float32	1
longitude	center longitude of each observation	degrees east	float32	1
longitude_bounds	corner coordinate longitudes of each observation	degrees east	float32	2
longitude_subsatellite	sub-satellite longitude of each observation	degrees east	float32	1
satellite_altitude	satellite altitude	m	float32	1
solar_azimuth_angle	at top of atmosphere	degree	float32	2
solar zenith_angle	at top of atmosphere	degree	float32	2
viewing_azimuth_angle	at top of atmosphere	degree	float32	2
viewing zenith_angle	at top of atmosphere	degree	float32	2

6 Geolocation Group for Limb Measurements

All Limb measurements have the following subgroup containing the coordinates for the measurements.

Table 41: Attributes for group GEODATA

Name	Value
top_of_atmosphere	100000m

Table 42: Variables of group GEODATA

Name	Description	Unit	Type	Dimensions
asm_position	azimuth scan mirror position	degree	float32	1
earth_radius	earth radius	m	float32	1
esm_position	elevation scan mirror position	degree	float32	1
latitude	tangent latitude at start, middle and end of integration	degrees north	float32	2
latitude_subsatellite	sub-satellite latitude of each observation	degrees north	float32	1
longitude	tangent longitude at start, middle and end of integration	degrees east	float32	2
longitude_subsatellite	sub-satellite longitude of each observation	degrees east	float32	1
satellite_altitude	satellite altitude	m	float32	1
solar_azimuth_angle	at top of atmosphere	degree	float32	2
solar zenith_angle	at top of atmosphere	degree	float32	2
tangent_height	tangent height of each limb observation	m	float32	2
viewing_azimuth_angle	at top of atmosphere	degree	float32	2
viewing zenith_angle	at top of atmosphere	degree	float32	2

7 ANNOTATION_DATA

7.1 LIMB_GEOLOCATION

Table 43: Attributes for group LIMB_GEOLOCATION

Name	Value
top_of_atmosphere	100000m

Table 44: Variables of group LIMB_GEOLOCATION

Name	Description	Unit	Type	Dimensions
delta_time	time offset in seconds from midnight	s	float64	1
integration_time	integration time of measurement	s	float32	1
solar Zenith_angles	solar zenith angles of the start, middle and end of the integration time at TOA	degree	float32	2
line_of_sight_angles	line-of-sight nadir angles of the start, middle and end of the integration time at TOA	degree	float32	2
relative_azimuth_angles	relative azimuth angles of the start, middle and end of the integration time at TOA	degree	float32	2
satellite_height	satellite geodetic height at the middle of the integration time	m	float32	1
earth_curvature_radius	earth curvature radius at the middle of the integration time	m	float32	1
sub_satellite_latitude	latitudes of sub-satellite points at the middle of the integration time	degrees north	float32	1
sub_satellite_longitude	longitudes of sub-satellite points at the middle of the integration time	degrees east	float32	1
tangent_ground_latitudes	latitudes of tangent ground points at the start, middle and end of integration time	degrees north	float32	2
tangent_ground_longitudes	longitudes of tangent ground points at the start, middle and end of integration time	degrees east	float32	2
tangent_height	tangent height at the start, middle and end of integration time	m	float32	2

7.2 NADIR_GEOLOCATION

Table 45: Attributes for group NADIR_GEOLOCATION

Name	Value
top_of_atmosphere	100000m

Table 46: Variables of group NADIR_GEOLOCATION

Name	Description	Unit	Type	Dimensions
delta_time	time offset in seconds from midnight	s	float64	1
integration_time	integration time of measurement	s	float32	1
solar Zenith_angles	solar zenith angles of the start, middle and end of the integration time at TOA	degree	float32	2
line_of_sight_angles	line-of-sight nadir angles of the start, middle and end of the integration time at TOA	degree	float32	2
relative_azimuth_angles	relative azimuth angles of the start, middle and end of the integration time at TOA	degree	float32	2
satellite_height	satellite geodetic height at the middle of the integration time	m	float32	1
earth_curvature_radius	earth curvature radius at the middle of the integration time	m	float32	1
sub_satellite_latitude	latitudes of sub-satellite points at the middle of the integration time	degrees north	float32	1
sub_satellite_longitude	longitudes of sub-satellite points at the middle of the integration time	degrees east	float32	1
corner_latitudes	latitudes of nadir ground pixel corners	degrees north	float32	2
corner_longitudes	longitudes of nadir ground pixel corners	degrees east	float32	2
center_latitude	latitudes of nadir ground pixel centers	degrees north	float32	1
center_longitude	longitudes of nadir ground pixel centers	degrees east	float32	1

7.3 STATES

Table 47: Variables of group STATES

Name	Description	Unit	Type	Dimensions
delta_time	time offset in seconds from midnight	s	float64	1
state_id	state ID	1	uint16	1
duration	duration of scan phase of the state	s	float32	1
longest_integration_time	longest integration time	s	float32	1
shortest_integration_time	shortest integration time	s	float32	1
number_observations	number of geolocation records for this state	1	uint16	1
corner_latitudes	corner latitudes of the ground scene which is covered by the state	degrees north	float32	2
corner_longitudes	corner longitudes of the ground scene which is covered by the state	degrees east	float32	2

8 GLOBAL_ANNOTATION_DATA

8.1 STATIC_PARAMETER

Table 48: Variables of group STATIC_PARAMETER

Name	Description	Unit	Type	Dimensions
xml_text_initialization_file	XML text of the initialization file which covers the complete range of static parameters	-	string	0

9 MEASUREMENT_DATA

9.1 LIMB_CLOUD

Table 49: Variables of group LIMB_CLOUD

Name	Description	Unit	Type	Dimensions
delta_time	time offset in seconds from midnight	s	float64	1
integration_time	integration time of measurement	s	float32	1
cloud_diagnostics	diagnostics of the cloud detection algorithm	-	uint8	1
water_cloud_flag	flag for water/ice/aerosol clouds	-	uint8	1
water_cloud_color_index_ratio_maximum_value	maximum value of CIR for water/ice/aerosol clouds	1	float32	1
water_cloud_height	height of maximum value of CIR for water/ice/aerosol clouds	m	float32	1
water_cloud_height_index	height index of maximum value of CIR for water/ice/aerosol clouds	1	float32	1
ice_cloud_flag	flag for ice clouds	-	uint8	1
ice_cloud_color_index_ratio_maximum_value	maximum value of CIR for ice/water clouds	1	float32	1
ice_cloud_height	height of maximum value of CIR for ice/water clouds	m	float32	1
ice_cloud_height_index	height index of maximum value of CIR for ice/water clouds	1	float32	1
polar_stratospheric_cloud_flag	flag for polar stratospheric clouds	-	uint8	1
polar_stratospheric_cloud_color_index_ratio_maximum_value	maximum value of CIR for polar stratospheric clouds	1	float32	1
polar_stratospheric_cloud_height	height of maximum value of CIR for polar stratospheric clouds	m	float32	1
polar_stratospheric_cloud_height_index	height index of maximum value of CIR for polar stratospheric clouds	1	float32	1
noctilucent_cloud_flag	flag for noctilucent clouds	-	uint8	1
noctilucent_cloud_height	maximum height of strictly monotonically increasing radiances for noctilucent clouds	m	float32	1

Continued on next page

Continued from previous page

Name	Description	Unit	Type	Dimensions
noctilucent_cloud_height_index	maximum height index of strictly monotonically increasing radiances for noctilucent clouds	1	float32	1
number_tangent_heights	number of tangent heights for CIR	1	uint16	1
tangent_heights	tangent heights for CIR	m	float32	2
color_index_ratios	color index ratios	1	float32	3

9.2 LIMB_UV_BRO

Table 50: Attributes for group LIMB_UV_BRO

Name	Value
fit_window	337-357nm
fit_species	BrO
observation_geometry	limb
second_fit_species	O3

Table 51: Variables of group LIMB_UV_BRO

Name	Description	Unit	Type	Dimensions
delta_time	time offset in seconds from midnight	s	float64	1
integration_time	integration time of measurement	s	float32	1
number_profile_entries	number of profile entries	1	uint8	1
number_measurement_levels	number of used measurement levels	1	uint8	1
tangent_layer_height_lower_layer_boundary	tangent height at the lower layer boundary	m	float32	1
tangent_layer_pressure_lower_layer_boundary	tangent layer pressure at the lower layer boundary	Pa	float32	2
tangent_layer_temperature	tangent layer temperature (mean)	K	float32	2
tangent_layer_volume_mixing_ratio	tangent layer volume mixing ratio	ppV	float32	3
tangent_layer_volume_mixing_ratio_error	error on tangent layer volume mixing ratio	relative fraction	float32	3
vertical_column_density_above_lower_layer_boundary	vertical column density above lower layer boundary	molecule/cm ²	float32	3
vertical_column_density_above_lower_layer_boundary_error	error on vertical column density above lower layer boundary	relative fraction	float32	3
measurement_grid_tangent_height	mean tangent height of measurement	m	float32	2
measurement_grid_tangent_pressure	pressure at tangent height	Pa	float32	2
measurement_grid_tangent_temperature	temperature at tangent height	K	float32	2
measurement_grid_number_windows	number of fitting windows	1	uint8	2
measurement_grid_minimum_wavelength	minimum wavelength over all fitting windows	nm	float32	2
measurement_grid_maximum_wavelength	maximum wavelength over all fitting windows	nm	float32	2

Continued on next page

Continued from previous page

Name	Description	Unit	Type	Dimensions
measurement_grid_delta_time	time offset in seconds from midnight	s	float64	2
state_vector_value	value of the state vector entry	1	float32	2
state_vector_error	error of the state vector entry	relative fraction	float32	2
correlation_matrix	correlation matrix of the fit	1	float32	2
root_mean_square	RMS of the fit	1	float32	1
chi_square	chi-square of the fit	1	float32	1
number_iterations	number of iterations for the non-linear fit	1	uint16	1
number_used_wavelength	measurement summary: number of used wavelengths	1	uint16	1
number_rejected_wavelength	measurement summary: number of rejected wavelengths	1	uint16	1
residuals	iteration step state vector residuals	1	float32	3
degree_of_freedom	degree of freedom	1	float32	1
diagonal_of_averaging_kernel	diagonal of averaging kernel	1	float32	2
number_density_retrieved	retrieved profile(s) in number density	molecule/cm ³	float32	3
number_density_initial	initial profile(s) in number density	molecule/cm ³	float32	3
scaling_factor_volume_mixing_ratio	scaling factor multiplied on profile(s) in partial columns to calculate profile(s) in volume mixing ratio	1	float32	2
scaling_factor_volume_number_density	scaling factor multiplied on profile(s) in partial columns to calculate profile(s) in number densities	1	float32	2
averaging_kernel	averaging kernel in partial columns	1	float32	4

9.3 LIMB_UV_NO2

Table 52: Attributes for group LIMB_UV_NO2

Name	Value
fit_window	420-470nm
fit_species	NO2
observation_geometry	limb
second_fit_species	O3

Table 53: Variables of group LIMB_UV_NO2

Name	Description	Unit	Type	Dimensions
delta_time	time offset in seconds from midnight	s	float64	1
integration_time	integration time of measurement	s	float32	1
number_profile_entries	number of profile entries	1	uint8	1
